SOONER OR LATER, we're all pestered by pests. Whether it's ants in the kitchen or weeds in the vegetable garden, pests can be annoying and bothersome. At the same time, many of us are concerned that the pesticides we use to control pests can cause problems too. How can pests be controlled safely? When and how should pesticides be used?

Eco-friendly chemical treatment

Consider chemical controls only if other techniques do not result in adequate pest control. Choose the chemical that is:

- Least harmful to the environment.
- Least toxic to the applicator.
- Most specific to the pest.
- Least harmful to beneficial organisms.

Properly timed applications maximize their effectiveness and reduce their potential impact on the environment maxima pest control company proudly says that we are using advanced equipment and well skilled technicians so we proved props and eco friendly treatment according in the different situations

The Inspection

The Inspection is the FIRST, most important meeting that we will have in your establishment. The maxima Inspection is specially designed to help guide your organization through simple recommendations and corrections that will assist in safeguarding your facility from those unwanted invaders. If you are not already familiar with the Integrated Pest Management program, also known as I.P.M., our Pest Management Professionals will show you and your staff how to implement this program into your daily sanitation procedures. I.P.M. is considered Green Technology and required by governmental agencies to be used in all state institutions, schools, daycares facilities and healthcare organizations. Pest control doesn't come in a can anymore —it now has taken the form of continuous education and teamwork between you as the customer and your Pest Management Professional

The MAXIMA Guarantee

Our services are guaranteed effective. If an infestation arises due to our negligence, we will make it our mission to eliminate the problem at no extra cost to you. If, for whatever reason, you are not satisfied with your Pest management Professional, we will simply train a replacement that you feel more comfortable working with. This is a team effort and it is our mission to make it work for all involved. The owner of maxima Pest Control prefers to inspect each commercial facility personally whenever possible, and is always available upon request.

Our individual custom programs will adjust according to a facility's needs. If more services are needed, those arrangements will be recommended and scheduled. When there seems to be a problem that is caused by structural soundness, it can sometimes prove impossible to eliminate certain invaders; however, you can be assured that they will be kept to the absolute minimum. WE GUARANTEE IT!

Cockroach

All cockroaches develop by completing a life cycle consisting of three distinct stages: egg, nymph, and adult. The overall life span of cockroaches differs as well -- some live only a few months while others live for more than two years. Cockroaches generally prefer warm, humid, dark areas. In the wild, they are most common in tropical parts of the world.

Mosquito

Mosquitoes have 4 life stages: egg, larva, pupa and adult. Mosquitoes can live and reproduce inside and outside the home. The entire life cycle, from an egg to an adult, takes approximately 8-10 days.

With a rich experience, a committed team of diligent and experts we are capable of catering our services to the various stages of mosquito's bite all over the space. Our team of experts has in depth knowledge and hands on experience in their respective domains who execute 2 operations very effectively within defined time.

Mosquitoes are born in the smallest areas of standing water. If you have cups, bowls, coolers or other containers around the outside of your home, sitting open, allowing rain to settle in them -- dump them out quickly.

Rats and mice

Although technically mice aren't bugs, we feel that the rate of house mice infestation is significant enough to warrant an article on this pest control site of ours. Mice and rats can be extremely difficult to tell apart with the exception being their difference in size.

For ordinary homes though, mice infestations are approximately 15 times more common compared to rat infestations so if you see one of these rodents in your house and they aren't terribly huge you can safely bet that it's a house mouse you're seeing.

Snap Traps

Firstly, the single most effective method of getting rid of mice is to trap them. An alternative here would be electrical traps. used to be a popular option years ago before significant drawbacks were discovered.

- Ecodon Herbal Extract
- Pavan Herbal Extract
- Rat bait station
- Rats Cakes
- Rats Liquid
- Glue pads
- Rats Paste
- Granules etc.

ANT OR TERMITE

One of the worst pests that can destroy your property are termites, which are actually very different from ants.

A typical termite colony is made up of over 300,000 to about a million of swarmers, soldiers and workers that can cause serious damages to your home. There are also some termites who live in water sources such as a leaky faucet or any damp areas produced by rain. They look for a place where there is moisture, so they will be able to survive and populate. A large percentage of termites are mainly subterranean, which means they dwell in the ground. These insects create tunnel systems in the soil, which may extend to a maximum depth of three feet.

1. Prepare a bait for subterranean termites.

a bait works by killing the entire colony at its primary source. You can set these baits deep in the ground, which may be at least every 10 feet or more around your home.

2. Use liquid termiticides.

Another effective solution to termites invading your home is the use of liquid termiticides.

Eco-friendly way to kill termites, the use of home remedies may be a viable option. Clove bud oil, for instance, is a type of essential oil that works efficiently in eradicating these pesky insects. heavy or thick vegetation as this can create moist areas that support the survival of a termite colony. wood or construction be sure to store termites Keep in mind that termites feed on wood, so any scrap of this material can be quite inviting to these pests.

We are so honoured to provide our services in organisation,
company we work hard to bring in to our notice.
If there is any inconvenience our services.
We would be most glad to learn and rectify them.
